

Data Appendix to "The Economy of People's Republic of China from 1953"*

Anton Cheremukhin, Mikhail Golosov, Sergei Guriev, Aleh Tsyvinski

July 2015

13 Data Appendix

We present data on six broad aspects of the Chinese economy: national accounts, labor inputs, capital inputs, foreign trade, prices and wages.

13.1 National Accounts

Our two main sources of data on the system of national accounts of China are published by the Chinese National Bureau of Statistics (NBS). The first one is the "China Statistical Yearbook" (CSY) which is available from the official website ([http://www.stats.gov.cn/english/Statisticaldata/ AnnualData/](http://www.stats.gov.cn/english/Statisticaldata/AnnualData/)) for the years 1996-2014. The second main source is the "60 Years of New China" (60Y) which aggregates data from previous publications for the years 1949-2009. (<http://tongji.cnki.net/overseas/engnavi/YearBook.aspx?id=N2010030107>). The second source is closely related with a book on pre-1996 statistics compiled by Hsueh and Li (1999), "China's national income 1952-1995" (HL).

Table 1 reports the Gross Domestic Product (GDP) measured as value added, for the whole economy and by sector, in current and constant prices, measured in 100 million yuan. Table 2 reports the Gross Domestic Product by Expenditure Approach, in current prices, measured in 100 million yuan. GDP is broken down into consumption, reported separately for households and for the government, gross capital formation (GCF), in turn broken down into gross fixed capital formation (GFCF) and inventories, and net exports. The table also reports data on foreign trade: total value of imports, exports and the trade balance.

*Cheremukhin: Federal Reserve Bank of Dallas; Golosov: Princeton and NES; Guriev: NES and Sciences Po; Tsyvinski: Yale.

The source of data for Tables 1 and 2 are "60 Years of New China", which only covers 1952-2008 for the series of interest.

Table 3 reports the Gross Domestic Product (GDP) measured as value added, for the whole economy and by sector, in current and constant prices, measured in 100 million yuan. Table 4 reports the Gross Domestic Product by Expenditure Approach, in current prices, measured in 100 million yuan. GDP is divided into consumption, reported separately for households and for the government, gross capital formation (GCF), in turn divided into gross fixed capital formation (GFCF) and inventories, and net exports. The table also reports data on foreign trade: total value of imports, exports and the trade balance.

The source of data for Tables 3 and 4 are "China Statistical Yearbooks" from 1996 to 2014, which only cover 1978-2012 for the series of interest.

In order to get consistent series for the whole period of interest, 1952-2012, we merge the data from the two sources. The two sources largely agree for the overlapping periods. However, there are some discrepancies between the two sources, with the earliest appearing for year 1990. For the conflicting cases we always prefer the most recent data vintage - CSY 2014.

Table 5 reports merged series for GDP by sector, in current and constant prices, for 1952-2012. Table 6 reports merged series for the breakdown of GDP by expenditure approach, also for 1952-2012.

13.2 Prices and Wages

To obtain a consistent series for GDP and its sectoral split into agriculture and non-agriculture, we need to obtain sectoral GDP deflators. We compute aggregate and sectoral GDP deflators using Table 5 by dividing value added in current prices by the indices in constant prices, and multiply each series by a constant that converts nominal values into constant 1978 yuan. We report the results in Table 7. Taking the ratio of price deflators in the two sectors allows us to estimate the relative prices of agricultural goods to non-agricultural goods.

We also report indexes of agricultural and industrial goods prices. These are the General Purchasing Price Index for Farm Products and the Ex-Factory Price Index for Industrial Products, available from the CSY for various years. For pre-1978 values we use values from CSY for year 1981.

In Table 8 we report average wages for staff and workers in the agricultural and non-

Table 1: Value Added by Sector, 60Y

year	Gross Domestic Product				Indices of Gross Domestic Product			
	Total	Primary	Secondary	Tertiary	Total	Primary	Secondary	Tertiary
1952	679.0	346.0	141.8	191.2	100.0	100.0	100.0	100.0

All values are measured in current prices, in 100 million yuan.

agricultural sectors for 1952-2011. These data come from two sources. The pre-1978 data come from CSY for year 1981. The post-1978 data come from CSY for years 1996-2013 from the official website. Two other columns report the factor share of income earned by labor in agriculture and non-agriculture, computed from Bai and Qian (2010), "The Factor Income Distribution in China 1978-2007."

We use the data on the labor share from Bai and Qian (2010) as a robustness check for our wage series. Figure 1 compares the ratios of agricultural to non-agricultural wage rates computed for staff and workers from the CSY (our baseline estimate) and inferred from the labor shares reported by Bai and Qian (alternative estimate) for the overlapping period 1978-2007. From Figure 1 we conclude that the ratio of agricultural to non-agricultural staff and worker wages follows the same trend as the ratio of labor remuneration in agriculture per agricultural worker to labor remuneration in non-agriculture per non-agricultural worker.

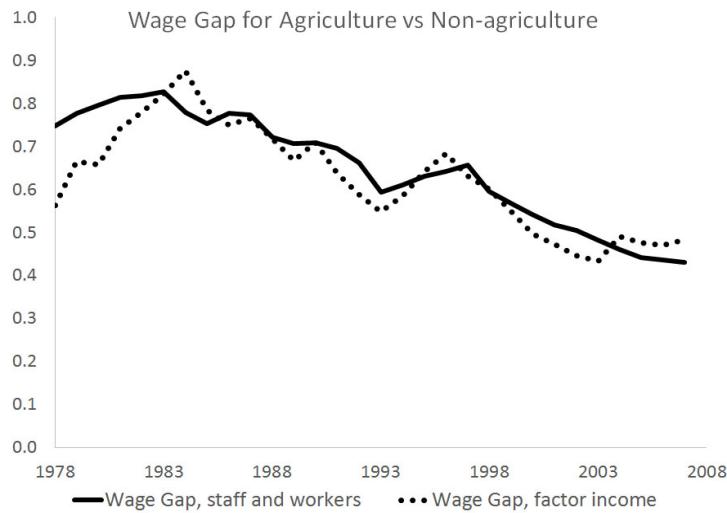

Figure 1. Measures of the wage ratio for agriculture and non-agriculture.

13.3 Labor Inputs

In Table 9 we report total population, total employment, employment in primary, secondary and tertiary sectors, measured in tens of thousand, from "60 Years of New China" (see previous section).

In Table 10 we report total population, total employment, employment in primary, secondary and tertiary sectors, measured in tens of thousand, from "China Statistical Yearbook".

Table 7: Price indices, Merge of CSY and 60Y, CSY 1981

year	Price Indices (1978=1)

2012	135404	76704	25773	23241	27690

Employment and population are measured in 10000 persons.

Table 11 reports merged series for population and employment by sector, for 1952-2012. We are interested in the division of economic activity into agricultural and non-agricultural. For this purpose, we treat the primary sector as agricultural, and add up employment in the secondary and tertiary sectors to obtain employment in the non-agricultural sector.

At this point, we incorporate a correction proposed by Holz (2006), Appendix 13, page 236. The correction takes care of the reclassification of employed workers that was made by the NBS in 1990. As a consequence, for years prior to 1990 total employment values are adjusted up by a factor of approximately 1,1666. This correction increases the size of total employment, but does not tell us anything about sectoral employment. To adjust also the breakdown of employment into agricultural and non-agricultural activity, we use the proportions obtained from the official series, as described earlier.

13.4 Capital Inputs

We use Holz (2006), Tables 19 and 20 on pages 159-161, as our main source for aggregate and sectoral capital stock. We repeat the data on total and primary capital stock in current and 2000 prices in the right two panels of Table 13. We convert the series for total capital stock to 1978 yuan using the GDP deflator (see subsection on prices and wages).

We use the level of capital and its ratio to GDP in 1953 to estimate the initial level of capital in 1978 prices. We apply the perpetual inventory method (with a depreciation rate of 5 percent) to our series for real investment in 1978 prices (computed using Gross Fixed Capital Formation as share of GDP) to obtain the series for aggregate capital in 1978 prices. The series that we obtain is largely consistent with Holz's estimates of aggregate capital stock for 1953-2006, with two minor differences: Holz computes capital in constant 2000 prices and uses a variable depreciation rate which ranges between 3 and 5 percent.

We also use data from Holz (2006) to divide the aggregate capital stock into capital used in the agricultural (primary) and non-agricultural sectors. This sectoral division of capital stock is only available for 1978-2011.

For earlier years we use the data on sectoral investment from Chow (1993) to estimate the composition of capital stock by sector. As shown in Table 12, we use net capital stock accumulation by sector from Table 5 on page 820 in Chow (1993), and then apply the perpetual inventory method to accumulate sectoral capital stock for 1953-1978. As initial values we use

Employment and population are measured in million persons.

the value from the same table for non-agricultural capital, and the value of 450 for agricultural capital. We then break down by sector the total real capital stock in 1978 prices computed earlier using the relative proportions implied by Chow's data.

To check the validity of this data, we construct sectoral capital series using provincial data on investment in fixed assets by type of unit from the China Compendium of Statistics 1949-2008 (Table 8). For 5 provinces (Fujian, Hunan, Jilin, Shanghai, Shanxi), the data on rural and urban investments go back to 1950; in case of Tianjin, they start in 1956. We attributed all the fixed asset investments of collectively-owned units in rural areas to the agricultural sector and all fixed asset investments in other units in rural areas and all units in urban areas - to the non-agricultural sector. This gave us data on investment by sector by province. We aggregated data on agricultural and non-agricultural investment for the available provinces. We found that the share of agricultural investment in total investment from this provincial dataset traces very closely the series obtained from Chow as described above. The similarity is illustrated in Figure 2.

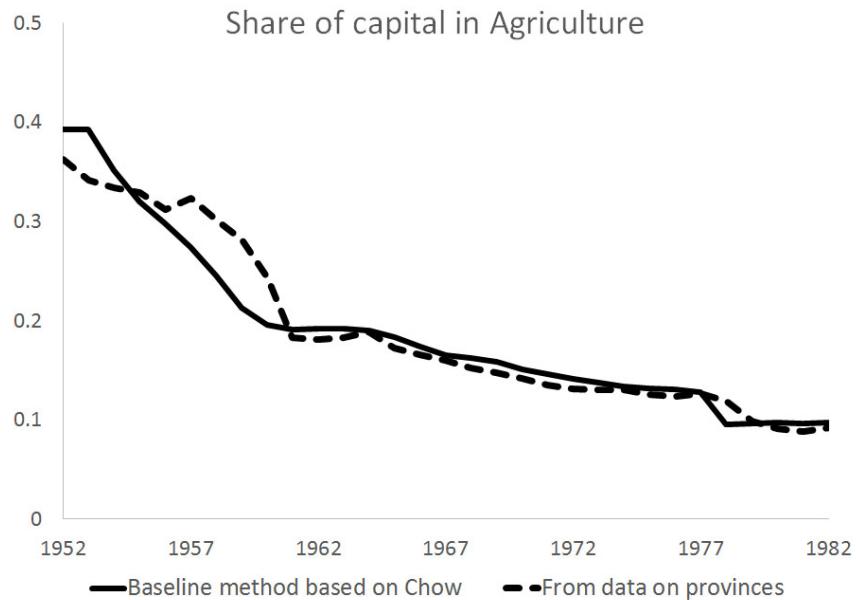

Figure 2. Measures of share of capital in agriculture.

Another source of data on sectoral capital stock for the pre-reform period is Tang (1984), Table 5. We find the series for Farm capital stock to grow at a rate similar to our baseline series, as shown in Figure 3. However, the level of Farm capital is less than half of the total agricultural capital stock in our baseline estimate, most likely because Farm capital aggregates

a restricted subset of items included in our baseline estimate.

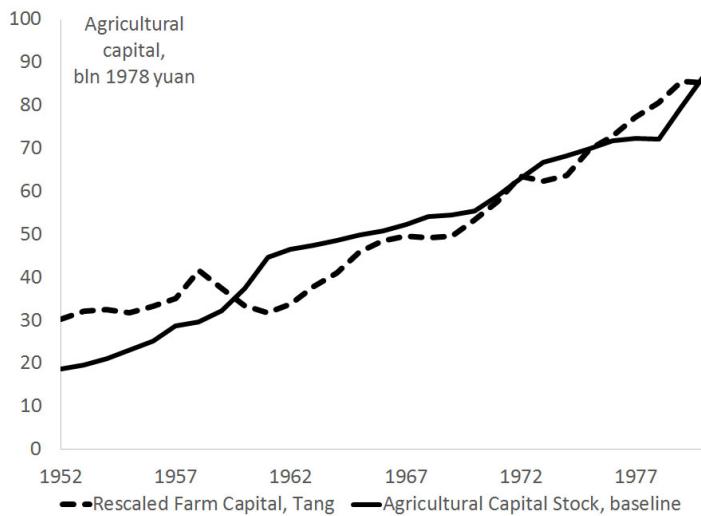

Figure 3. Measures of agricultural capital.

For the most recent period, 2003-2012, we use CSY 2013, Table 5-9, Investment in Fixed Assets, total and in the agricultural sector, to compute the breakdown of investment into agricultural investment and non-agricultural investment. Using the perpetual inventory method, we compute capital by sector in 2003-2012.

13.5 Defense Spending

The data on defense spending comes from three main sources. The earlier period of 1952- 1995 is jointly covered by HL and CSY, which report nominal defense spending in yuan. For the period 1983-2011 an alternative source of data is the website of the Stockholm International Peace Research Institute (SIPRI) which reports spending on defense for a variety of countries as a percent of GDP. For the overlapping period the trends are broadly consistent, but the exact estimates vary by a factor of 1 to 1.5. As there seems to be no reliable way of obtaining more precise estimates, we average the two available sources for the overlapping period. We obtain an estimate of real defense spending in 1978 prices using the share of defense in GDP from these two sources.

13.6 Foreign Trade

The main source for data on sectoral exports and imports is Fukao, Kiyota and Yue (2006). Fukao et. al. (2006) report data on China's exports and imports by commodity at the SITC-R

2-digit level for 1952-1964 and for 1981-2000, obtained from the "China's Long-Term International Trade Statistics" database. Using data from Fukao et. al. (2006), we construct estimates of nominal exports and imports of agricultural and non-agricultural commodities. We then subtract imports from exports to obtain estimates of net exports by sector. We use the price deflators computed earlier to estimate real net exports by sector in 1978 prices. For the 1965-1980 period, to our knowledge, there is no available data on trade by sector. We linearly interpolate the ratios of net export to value added by sector for this intermediate period. For the 2001-2012 period we use data directly comparable to that reported by Fukao et. al. (2006), now available in CSY.

13.7 Three Sectors

For the 3-sector model we break down non-agricultural sector into its state and private components. For modeling purposes, we are interested in the breakdown of production (value added), labor inputs and capital inputs. The separation of the sectors occurs only after the reforms started in 1978. Before that, there was hardly any non-state non-agricultural production. So we construct the breakdown for the 1978-2012 time period. Our first main source is Dekle and Vandenbroucke (2006) "A quantitative analysis of China's structural transformation" (DV). DV report fractions of value added produced by the state and private sectors for 1978-2003. They also report data on the split of capital and labor inputs for the same period. For later years we use data from the CSY and follow DV's methodology wherever possible. We replicate DV's numbers very closely for the overlapping period (1985-2003), which is encouraging.

To obtain a breakdown of value added we use "gross industrial value added" from CSY, for which split is reported into state-owned, collective, individual and other/foreign. We attribute state-owned and collective to the state sector and all other categories to the private sector.

To obtain a breakdown of employment we use Table 4-2 "Number of Employed Persons at Year-end in Urban and Rural Areas" which reports total number of employed, as well as those employed in state-owned, collective-owned, cooperative and TVEs. We attribute the four aforementioned categories to the state sector, and the rest to the private sector.

To obtain a breakdown of capital we use data on the "Original Value of Fixed Assets of Industrial Firms above certain size" which are reported for all industrial firms and for state-owned enterprises. We use these data to split total investment in the non-agricultural sector

Table 15: Foreign Trade by Sector (CSY, Fukao Kiyota Yue (2006))

year	Share of Agric goods in		Sectoral Trade

2011	0.028	0.025	631.86	-9447.34
2012	0.027	0.029	191.15	-14367.14

Values in the right panel are measured in current prices, in 100 million yuan.

(see subsection on capital) into state non-ag. investment and private non-ag. investment. We merge these series with data from DV starting from the year 1998. We then apply the perpetual inventory method (with constant 5-percent depreciation rate) to obtain the series for capital in state non-ag. sector and private non-ag. sector.

Our constructed shares of value added, employment and capital stock in the state non-ag. sector are reported in Table 16.

13.8 Final Dataset

In this subsection, we combine series constructed and reported in previous subsections into a final dataset. Tables 17 and 18 present the combined dataset used in the analysis.

Table 17 presents total value added (GDP), value added by agriculture (YA) and non-agriculture (YM), which in turn is split into state (YS) and private (YP) non-agriculture. Agricultural value added is either consumed (CA) or exported (exA). Non-agricultural value added produced (YM) plus imported (ImM) is used either for consumption (CM), investment (Inv) or defense spending (GM). All values in Table 17 are in constant prices in 100 million of 1978 yuan.

The left panel of Table 18 presents total capital stock (K) broken down by sector: agriculture (KA), non-agriculture (KM), in turn broken down into state (KS) and private (KP) non-agriculture. Like value added, the capital stock is measured in 100 million of 1978 yuan. The central panel of Table 18 presents total employment (N) split into: agriculture (NA), non-agriculture (NM), in turn split into state (NS) and private (NP) non-agriculture. Employment, as well as total population (POP), are measured in million persons. The right panel of Table 18 presents the index of relative prices of agricultural and non-agricultural goods (pA/pM) and the ratio of wages in agriculture to wages in non-agriculture (wA/wM). The index of relative prices is normalized to 1 in 1978.

Table 16: Size of State sector (CSY, Dekle and Vandenbroucke (2006))

year	Share of State in Non-agricultural		
	Employment	Value Added	Capital Stock
1978	0.930	0.997	0.951
